

Product Packaging and Storage Guidelines

At DwyerOmega, we take great care and pride in selecting packaging that provides the highest level of protection for our products. Our packaging is carefully chosen to safeguard product quality during storage, handling, and transportation.

This document has been developed to help ensure that our products continue to receive that same level of protection throughout their use and lifecycle.

To maintain product integrity and prevent damage, all products should be stored in their original packaging whenever they are not in use. This includes, but is not limited to, plastic tubes, protective containers, equipment cases, and any other packaging specifically designed for the product.

When products need to be transported or shipped, the original packaging should be used whenever possible. Using the original packaging provides the appropriate level of protection during handling and transit, helping to minimize the risk of damage and ensuring the product arrives in the same condition in which it was manufactured. Preserving and reusing the original packaging is a simple but important step in protecting our products and ensuring they continue to perform as intended.
